Nuclear magnetic resonance imaging (MRI) and magnetic resonance imaging (MRI) are increasingly used as imaging techniques in the clinical setting. However, these technologies suffer from a limited specificity in the sense that they can be applied only to certain types of tissues, and they are insensitive. New contrast agents that rely on interactions with target molecules in the body can be used to increase the specificity and sensitivity of these techniques. In the realm of MRI, lipid-based contrast agents have the advantage of being biocompatible and biodegradable. This article summarizes the development of lipid-based MRI contrast agents and the methodology that has been applied to the development and evaluation of these new agents. // (C) Copyright Dave Abrahams, Steve Cleary, Beman Dawes, Howard // Hinnant & John Maddock 2000. // Use, modification and distribution are subject to the Boost Software License, // Version 1.0. The DBMS provides protection against hacker attacks.Modern networking technology has evolved in recent years to provide advanced services and capabilities to customers. As the cost of networks decreases and the ability of networking equipment to provide greater functionality increases, businesses and consumers are becoming aware of the benefits that can be achieved by networking their personal computers and other devices together in a local area network (LAN). LANs differ from wide area networks (WANs) in that WANs provide connectivity between LANs, and are typically used for purposes such as telecommuting and long-distance business applications. Once a LAN is established, various levels of network topology are possible. One arrangement is a star topology, where the network is organized such that all devices on the network are coupled to one common node (the star). Devices in a star-topology network communicate directly with the star node, without the need for intermediate coupling. Further communication between the devices occurs by sending packets from one device to the star node. The star node then broadcasts the packets to all devices on the LAN. Another arrangement of a LAN is the peer-to-peer topology, where two or more LANs are connected to one another using a router. Packets are routed through the router by the router, from a sending device on 79a2804d6b
